

10X ROI: Vision ONE

BRINGING SECURITY INTO FOCUS

CHALLENGE

The first step to better security is better visibility, but the job is not an easy one. Nearly 1M new threats appear daily while IoT, BYOD and data center migration add new risk and complexity.

Security tools are only as effective—and efficient—as the data they receive and act upon. A new visibility paradigm is needed to deliver reliable data, control costs, and amplify security—without sacrifice.

SOLUTION

Ixia's innovative Vision ONE network packet broker (NPB) changes the game, fusing essential elements of network visibility into one powerful, scalable, easy-to-deploy solution. Vision ONE combines advanced functions like application filtering, line-rate de-duplication, SSL decryption, inline service-chaining, and load balancing that extends the value of existing tools.

Amplify security and improve the effectiveness of existing tools. With this advanced inline solution, the industry's simplest user interface, and a 10x ROI—or better.

Security without Sacrifice: Vision ONE combines the best and most timely elements of visibility to make security operations more efficient. This includes real-time intelligence from Ixia's Application & Threat Intelligence (ATI) feed and 100% reliable packet processing validated by third-party testing.

THE 10X—OR BETTER—ROI

Vision ONE delivers 10x or better ROI by:

- **Equipping IT to work faster:** Ixia's simple-to-use GUI lets IT teams work 10x faster than CLI-based alternatives—focus on security vs. configuration!
- **Extending the life of existing investments** so you don't need to invest in migrating to higher performance levels prematurely
- **Improving availability and network uptime** by 5x or better for inline tools
- **Transforming data** that analysis tools might not natively interpret (SSL-encrypted, VM and VNTagged traffic) for improved access to data flows through the network
- **Filtering out traffic** not requiring analysis to reduce the burden on tools
- **Improved rack space utilization** in the data center with a highly compact 1U form factor

Vision ONE

VISION ONE HIGHLIGHTS

- **Comprehensive network visibility:** Every feature IT will ever need in a compact 1U form factor
- **Powerful inline** & out-of-band solution
- **Reliability:** ZERO-loss, line-rate advanced performance with no dropped packets
- **Powerful GUI** with industry-best ease-of-use
- **SSL decryption** detects hidden threats
- **Easily expand deployments** to meet changing needs
- **Advanced features:** Filtering, de-duplication, load-balancing, timestamping, and more
- **VM-ready** with support for physical and virtual taps across a common infrastructure
- **Optimizes security in multiuser environments** with extensive role-based access control and a powerful filter compiler that ensures users do not impact one another while using the system concurrently

Vision ONE delivers increased benefits over time by optimizing the use and cost of existing tools. For example, if deduplication removes 2 duplicates for every packet sent, this reduces traffic volumes to existing tools by roughly 66%, and in turn the rate at which additional tools need to be added.

Benefits and ROI improve as traffic loads and the percentage of traffic that can be eliminated via deduplication, decapsulation, or filtering increases.
